

FOLDING SPEAKER BRACKET

Abstract of the Disclosure

A folding speaker bracket is described comprising a first half and a second half, wherein the first half is rotably connected to the second half, so as to define an axis about which the first and second halves may rotate. By this rotatable attachment of the two halves, the speaker may be folded and then inserted through a hole in a mounting surface that is smaller than it would have been if the bracket did not fold.
